Eugene issues
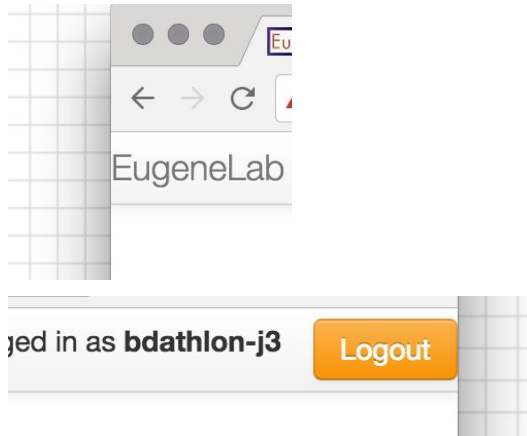

The SSL certificate is bad, throws warnings in browser

If you fill in the "sign up" form to login, nothing happens
There is a separate login form above which is confusing

A "hello world" example on first login would be nice - it says "click run to try eugenelab" but the text box is empty so nothing happens

The documentation is an embedded PDF which isn't very user friendly

Some padding on left and right of titlebar would look much nicer

Documentation references to sections is broken see e.g. ("see Section ??")

Documentation is rather sparse, especially for Rules section. Existing examples in literature all throw errors, making it very hard to use. There are not enough examples that work with the current version of EugeneLab.

Can't get product() function to work easily, many errors.

Cryptic error messages: "Exception: org.cidarlab.eugene.exception.EugeneException: @Error! Line 25 Position 14 [prog, statement, dataExchange, sbolStatement, sbolVisualStatement, expr,

multExpr, atom] no viable alt; token=[@249,577:577=')',<97>,25:15] (decision=91 state 0) decision=<<>> "
